                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Region
    This sequence represents a high-affinity sodium dependent L-Proline transporter derived from rat brain. This transporter protein has a mol. wt. of 71 kb. Hydropathy analysis of the protein reveals the presence of 12 regions of significantly extended hydrophobicity suitable for the formation of transmembrane domains. The N-terminus does not contain a readily identifiable signal sequence, suggesting that the N-terminus resides on the cytoplasmic face of the membrane. Comparison of the amino acid sequence with known neurotransmitter
                                                                                                                                                                                           transporters reveals significant amino acid conservation, specifically 148 amino acids are conserved among cloned neurotransmitter transporters. Many of the conserved residues are within or adjacent to the presumed transmembrane regions.
                                 DNA encoding sodium dependent L-proline transporter protein - for expression of protein and for diagnostic, research and drug design
                                                                                                                                                                                                                                                                                                                                                                                                                190 rGluGluTyrTrpSerArgTyrValLeuHisIleGlnGlySerGlnGlyI 207

The present sequence represents rat proline transporter (rPROT), which is a high-affinity, Na+-dependent L-proline transporter expressed in the brain. The present invention also describes an antibody that is specifically reactive with the L-proline transporter and does not cross react with any other neurotransmitter transporter. The antibody can be used in assays for detecting the L-proline transporter in samples containing one or more proteins. The DNA encoding the polypeptide can be used for recombinant production of the transporter. The polypeptide can be used to make antibodies, in research studies, and in the design of modulating compounds for clinical treatments. This is useful as the transporter is thought to be involved in the release of amino acid transporters for excitatory pathways in the central nervous system. The products can be used to study function and disorders involving these transporters.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            L-proline transporter polypeptide - used for study of the transporter and antibody against it for detection of the transporter
                                                                                                                     /hote= "membrane->pu......

Group A Eimeria tenella protein immunogen, produced recombinantly.
Used in vaccines to prevent coccidiosis from Eimeria tenella
infection.

The invention provides vertebrate (human) protein homologue of a UNC-53 protein of Caenorhabditis elegans. The UNC-53 binds to microtubules or their plus ends. The UNC-53 sequences are used to promote neural regeneration, revascularization and wound healing; also for treating neurodegenerative disease, acute traumatic injury, fibrotic disease and autoridament diseases (e.g. rheumatoid arthritis and sclerosis). The UNC-53 polynuclectides can be used for recombinant production of the proteins, as a source of probes for detecting allelic variants and polymorphisms, for sequencing genomic DNA and for detecting UNC-53 expression; and as source of therapeutic antisense sequences. Cells that express the protein are used to identify regulators of cell shape, growth, motility can make an also be used to identify proteins that are involved in signal transduction pathways also involving UNC-53, and to identify compounds that alter attachment of UNC-53 to microtubules. A target gene coupled to a UNC-53 encoding sequence may be used to deliver sequence represents the anino acid sequence of the third human homologue of UNC-53, designated hs-UNC-53/3.
                                                                                                                                                                                              Novel proteins and nucleic acids e.g. for treating neurodegeneration

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       185
                                                                                                                                                                                                                                                                           317
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            from diycine max. This protein is used in a method resulting in the production of a modified plant sucrose binding protein (SBP) which has a modified amino acid sequence compared so a corresponding wild-type SBP, and where expression of the modified SBP in a yeast assay system confers enhanced sucrose uptake compared to the corresponding wild-type SBP. The products of the invention can be used for producing transgenic plants which have modified sucrose uptake activity, particularly in developing seeds. Enhanced sucrose uptake activity in developing seeds may be desirable where it is an advantage to increase the carbohydrate content of the seed (e.g. where the seed is the primary plant material harvested) such as soybean. In contrast, decreased sucrose uptake activity in seeds might be desirable where the vegetative material harvested harvested. The SBP regulatory regions confer specific or enhanced expression in developing seeds and so may be used to express any
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents a novel sucrose binding protein, SBP2 isolated
                                                                                                                                                                                                                                                                                                                                                                                                                       sucrose binding protein; SBP2; sucrose uptake; transgenic plant; carbohydrate content; soybean.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New modified plant sucrose binding proteins - used to develop transgenic plants which can have enhanced or decreased sucrose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 437 AGACACGAGTACATGGCTAAGAAGTAGTACCACTACAAAGGGAAACGAAG 388

                                       This sequence represents a novel sucrose binding protein, SBP2 isolated from Glycine max. This protein is used in a method resulting in the production of a modified plant sucrose binding protein (SBP) which has a modified amino acid sequence compared to a corresponding wild-type SBP, and where expression of the modified SBP in a yeast assay system confers connect sucrose uptake compared to the corresponding wild-type SBP.

The products of the invention can be used for producing transgenic plants which have modified sucrose uptake activity, particularly in developing seeds. Enhanced sucrose uptake activity in developing seeds. Enhanced sucrose uptake activity in developing seeds may be contained to increase the carbohydrate content of the seed (e.g. where the seed is the primary plant material harvested, such as soybean). In contrast, decreased sucrose uptake activity in seeds might be desirable where the vegetative material of the plant is harvested. The SBP regulatory regions confer specific or enhanced contents to express any

```
The invention relates to the production of analogues of a heterodimeric subunit glycoprotein hormone (GPH) e.g. human chorionic gonadotropin (ChGG), human luteinising hormone (high), human follicle stimulating normone (high), human thyroid stimulating hormone (HTSH), and functional contains, which are modified to contain an intersubunit disulphide bond, between an alpha-subunit cysteine and a beta-subunit cysteine, for improved stability, the analogue retaining at least a portion of the bloactivity for the corresponding native GPH receptor. Sequences contained GPHs. The improved analogues are designed specifically to reduce perturbation of the 3-dimensional structure of the hormone, thereby creating greater likelihood that the dimer will be formed in vivo and the formed dimer will have affinity for the native receptors and have agonistic activity on them. The changes stabilise the GPHs and prological activities of the hormones. The analogues can have uses as for the native GPHs.
                                                                                                                                                                                                                        disulphide bond;
                                                                                                                                                                                      Analogue; heterodimeric; glycoprotein hormone; hCG; hLH; hFSH; hTSH; human chorionic gonadotropin; human luteinising hormone; disulphide bow human follicle stimulating hormone; human thyroid stimulating hormone;

The invention provides vertebrate (human) protein homologue of a UNC-53 protein of Caenorhabditis elegans. The UNC-53 binds to microtubules or their plus ends. The UNC-53 binds to microtubules or their plus ends. The UNC-53 binds to microtubules or regeneration, revascularization and wound healing; also for treating neurodegenerative disease, acute traumatic injury, fibrotic disease and autorodegenerative disease, acute traumatic injury, fibrotic disease and neurodegenerative disease, etc., rheumatiol arthritis and solerosis. The polynuclectides can be used for recombinant production of the proteins, as a source of probes for detecting allelic variants and polymorphisms, for sequencing genomic DNA and for detecting UNC-53 expression; and as source of therapeutic antisense sequences. Cells that express the protein are used to identify regulators of cell shape, growth, motility and migration. They can also be used to identify proteins that are involved in signal transduction pathways also involving UNC-53, and to identify compounds that alter attachment of UNC-53 to microtubules. A target gene coupled to a UNC-53 encoding sequence may be used to deliver the target gene to a cellular microtubule or its plus ends. The present sequence represents the amino acid sequence of a full-length Hs-UNC-53/31 in fusion with GFP insert of plasmid pGI3305.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel proteins and nucleic acids e.g. for treating neurodegeneration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Geysen JJGH, Bogaert TAOE;

to a particular environment comprising the steps of: (1) providing a

plurality of microorganisms each of which is independently mutated by

the insertional inactivation of a gene with a nucleic acid comprising

a unique marker sequence so that each mutant contains a different

marker sequence, or clones of the said microorganism; (2) providing

individually a stored sample of each mutant produced by step (1) and

providing individually stored nucleic acid comprising the unique

marker sequence from each individual mutant; (3) introducing a

c plurality of mutants produced by step (1) into the said particular

c plurality of mutants produced by step (1) into the said particular

c plurality of mutants produced by step (1) into the said particular

c providing individually those microorganisms which are able to do so

c to grow in the said environment; (4) retrieving microorganisms from

the said environment or a selected microorganisms; (5) comparing any

marker sequences in the nucleic acid isolated in step (4) to the

unique marker sequences as isolated in step (4). The products and

methods can be used for identifying virulence genes in microorganisms.

The mutant microorganisms can be used in vaccines or to screen for

drugs which reduce virulence or compounds useful for preventing,

ameliorating or treating infections in animals or plants.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence is encoded by the acute lymphoblastic leukemia (ALL-1)
gene of chromosome 11. The ALL-1 gene was isolated by translocation
breakpoint mapping. Fragments of the ALL-1 cDNA may be used to
identify chromosomal abnormalities within the ALL-1 gene. These
fragments may be used in the treatment and diagnosis of human
leukemias such as acute lymphocytic, myelomonocytic, monocytic and
myelogenous leukemia. ALL-1 protein shows three regions of homology
to the Drosophila trithorax protein. These regions of homology
to the Drosophila trithorax protein. These regions show 64%, 66% and
82% similarity respectively, to the Drosophila gene. The third region
of homology constitutes the extreme C-terminus of the two proteins,
both proteins end in an identical sequence. The first homology region
is cysteine-rich and contains sequence motifs analogous to four zinc
finger domains (3-6) within the trithorax gene. The second region of
chamology is also cysteine-rich and corresponds to zinc fingers 7 and 8
che brosophila gene. The multiple conserved cysteines and
the putative fingers. The structure of these arrangements
of the putative fingers. The structure of these arrangements
                                                                                                                               /note= "Region of homology to Drosophila trithorax".

                                                                                                                                                                                                                                                                                         The ALL-1 cDNA was obtained from a series of overlapping clones spanning 14.7 kb, isolated by screening a human fibroblast library and a K562 library. The sequence revealed a single, long ORF predicting a protein of approx. 4000 amino acids. The predicted amino acid sequence includes regions of homology with the Drosophila trithorax gene which contain zinc-finger domains. The multiple conserved cysteines and histidines at the 3' end of the motifs allow two or three arrangements of the putative fingers. The ALL-1 gene on chromosome 11 is involved in a series of chromosomeal translocations which are associated with certain
                                                                               "region of homology to Drosophila trithorax located at extreme C-terminus of both proteins"

In the course of the construction of a physical map of human chromosome region 11q23, a region contg. the t(4;11) translocation breakpoint was cloned. The cloned DNA encoded a protein homologous to the trithorax gene prod. of Drosophila. The gene may be used for the diagnosis and treatment of immunodeficiency states, developmental abnormalities, inherited diseases or cancers, e.g. acute lymphocytic leukaemia or acute myelomonocytic leukaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; trithorax gene; L01986; diagnosis; treatment; immunodeficiency; developmental abnormalities; inherited diseases; cancer; acute lymphocytic leukaemia; myelomonocytic leukaemia.

Analogue 4 (human FSH-beta(1-111)-linker-human-alpha(1-92)) is a specific example of a single chain gonadotropin; chimeric proteins having a chorionic gonadotropin (CG) beta-subunit at the N-terminus and a CG alpha-subunit at the C-terminus, joined by a linker of 1-16 amino acids are claimed. The analogue has follicle stimulating hormone (follitropin) activity and is useful for inducing follicle development and increasing male fertility.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Single chain gonadotropin; human chorionic gonadotropin; hCG; alpha; beta; subunit; analogue; glycoprotein hormone; fertility; inhibit; stimulate; increase; lutropin; luteinising hormone; LH;
                                                                                                  of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Region
                                                     268
                                                                                                                                                                                                                                                                  Analogue 5 (hCG-beta(1-93)-hFSH-beta(88-111)-linker-human alpha(1-92)) is a specific example of a single chain gonadotropin having a chorionic gonadotropin (CG) beta-subunit at the N-terminus and a CG alpha-subunit at the C-terminus, joined by a linker of 1-16 amino acids. The analogue has follicle stimulating hormone (follitropin) activity but is more structurally similar to hCG then to hFSH. The analogue is useful for inducting follicle development and increasing male
                                                                                                                                                                                                                                                                                                                                                                                                                                  Methods for altering fertility in mammals, esp. humans - e.g. stimulating fertility by reducing the activity and/or levels of circulating glyco:protein hormones having lutropin activity

Analogue 6 (hCG-beta(1-100)-hFSH-beta(95-111)-linker-human alpha(1-92)) is a specific example of a single chain gonadotropin having a chorionic gonadotropin (CG) beta-subunit at the N-terminus and a CG alphasubunit at the C-terminus, joined by a linker of 1-16 amino acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Single chain gonadotropin; human chorionic gonadotropin; hCG; alpha; beta; subunit; analogue; glycoproctein hormone; fertility; inhibit; stimulate; increase; lutropin; luteinising hormone; LH; follicle stimulating hormone; FSH; vaccine; contraceptive.

           luteinising hormone (lutropin) activity but is structurally more similar to hCG then to hFSH. The analogue is useful for inducing follicle development and increasing male fertility.
The analogue has follicle stimulating hormone (follitropin) and

The present sequence is that of human BGF-Hyl, a novel epidermal growth factor (BGF)-repeat region of Notch, a protein involved in call fate control mechanisms regulating multicellular development. The sequence was deduced from RACE clones (see rested, only foetal liver, foetal brain library. Of 18 human tissues tested, only foetal liver, foetal skin, foetal brain and adult lung expressed EGF-Hyl, suggesting expression mainly in developmental tissues. EGF-Hyl includes 3 EGF repeats, and polypeptides comprising these repeats are also claimed. An additional sequence for EGF-Hyl (see AAY7931) was also deduced from a PCR clone. The invention also provides methods for the use of EGF-Hyl polypeptides and polynucleotides as diagnostics, therapeutics and research reagents. In particular, they are used for diagnosis, prognosis or monitoring of cancer. They can also be used for stimulating and suppressing the immune system, and hence in treating immune deficiencies and disorders including infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       chemotaxis/chemokinesis, haemostasis, thrombolysis, receptor/ligand binding, antiinflammatory responses, leukaemia and nervous system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human EGF-Hyl polypeptide and polynucleotide sequences, useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          multiple sclerosis, rheumatoid arthritis, myasthenia gravis

```
Overlapping clones, which make up the cDNA sequence from which this sequence was deduced, were isolated from a cDNA library prepared from human NK cells purified from human peripheral blood. The purified protein can mediate the cytolytic activity of mammalian cells. It specifically distinguishes tumour cells making it a candidate for the development of products for the immunodetection and immunotherapy of tumours. See also AAQ13115.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               46
  AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY75941 and polypeptides. AAZ54576 and AAZ54616 to AAZ5473 represent properties. AAZ5437 to AAZ54576 and AAZ54616 to AAZ5473 represent PCR primers used in the exemplification of the present invention. The polypeptides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Neisseria meningitidis; Neisseria gonorrheae; antigen; vaccine;

represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ5457 to AAZ54576 and AAZ54616 to AAZ55473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Weisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ξ

The single-chain gonadotropin analogue 4b (human FSH-beta(1-111) [N7X,N24X,D71N,L73T]-linker-human CG-alpha(1-92)[N52X,N78X]) is an example of a chimeric glycopeptide hormone having an extra glycopeptide hormone having an extra glycosylation site. Addition of oligosaccharides has a positive effect on stability of hormones in circulation and can be used to prevent unwanted antibody or receptor interactions. The present analogue has anti-follicle stimulating hormone (follitropin) activity and is useful for treating ovarian hyperstimulation and reducing spermatogenesis.
                                          of
Methods for altering fertility in mammals, esp. humans - e.g. stimulating fertility by reducing the activity and/or levels circulating glyco:protein hormones having lutropin activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 131

The single-chain gonadotropin analogue 5b (human CG-beta(1-93) [N13X,N30X,P78X,V79T]-hFSH-beta(88-111)-11nker-human CG-alpha(1-92) [N52X,N78X]) is an example of a chimeric glycopeptide hormone having an extra glycosylation site. Addition of oligosaccharides has a positive effect on stability of hormones in circulation and can be used to prevent unwanted antibody or receptor interactions. The present analogue has anti-follicle stimulating hormone (follitropin) activity and is useful for treating ovarian hyperstimulation and reducing spermatogenesis.
                                                                                                                                                                        beta-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Region
                                268
                                                                                                                                                                                           The single-chain gonadotropin analogue 6b (human CG-beta(1-100) [N13X,N30X,P78X,V79T]-hFSH-beta(95-111)-linker-human CG-alpha(1-92) [N52X,N78X]) is an example of a chimeric glycopeptide hormone having an extra glycosylation site. Addition of oligosaccharides has a positive effect on stability of hormones in circulation and can be used to prevent unwanted antibody or receptor interactions. The present analogue has anti-follicle stimulating hormone (follitropin) and anti-luteinising hormone (lutropin) activity and is useful for treating ovarian hyperstimulation and reducing spermatogenesis.
                                                                    /note= "wild-type Asn at position 52 of the alpha-
subunit is pref. replaced by another amino
acid (esp. Gln) to remove a glycosylation
site"

                                                                                                                                                                                                                                                                                                                        Region
   The single-chain gonadotropin analogue 5a (human CG-beta(1-93) [N13X,N30X]-hFSH-beta(88-111)-linker-human CG-alpha(1-92)[N52X,N78X]) can be derived from analogue 5 by removing at least one of the four glycosylation sites. The partially deglycosylated analogue has antifolicle stimulating hormone (follitropin) activity and is useful for treating ovarian hyperstimulation and reducing spermatogenesis.
                                                                                        Methods for altering fertility in mammals, esp. humans - e.g. stimulating fertility by reducing the activity and/or levels of circulating glyco:protein hormones having lutropin activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Partially deglycosylated single chain gonadotropin analogue 6a

The single-chain gonadotropin analogue 6a (human CG-beta(1-100) [N13X,N30X]-hFSH-beta(95-111)-linker-human CG-alpha(1-92)[N52X,N78X]) can be derived from analogue 6 by removing at least one of the four glycosylation sites. The partially deglycosylated analogue has antifollule stimulating hormone (follitropin) and anti-luteinising hormone (tollitropin) activity and is useful for treating ovarian hyperstimulation and reducing spermatogenesis.
                                                                                                                                                                                                                                                                                                                                              "wild-type Asn at position 13 of the beta-
subunit is pref. replaced by another amino
acid (esp. Gln) to remove a glycosylation
site"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      "wild-type Asn at position 30 of the beta-subunit is pref. replaced by another amino acid (esp. Gln) to remove a glycosylation site"

region of human and mouse agoutilrelated transcript (ART) protein. These peptides can be used to inhibit binding of melanocyte stimulating hormones (MSHs) to melanocortin receptors. The ART proteins form a part of fusion proteins which have an amino acid sequence from the ART protein fused at its carboxy terminus to one or more amino acid sequences not derived from the ART protein. The ART polypeptides can be used to identify inhibitors and allosteric enhancers of the binding of the ART polypeptide to melanocortin receptors. The ART protein is also a regulator of human obesity, and substances that potentiate the effect of the ART protein on melanocortin receptors are likely to be of value in the control of body weight. Sequences AAVI2N61-861-863 represent specific examples of ART polypeptides that can be used in the invention. The present sequence represents a fusion protein containing the ART protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; 5' EST; expressed sequence tag; secreted protein; cDNA isolation; gene therapy; chromosome mapping.
invention provides novel polypeptides derived from the C-terminal

The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from menas encoding secreted proteins. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.
                                                                                                                                                                                                       New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               94 TGGCACGCCATAATGGAAAACAGTCCCTGCCCTTTTGAGGGTCGTCTCAA 143

```
The present sequence is a polypeptide which is expressed in mammalian skin cells. The polypeptide is useful for stimulating keratinocyte growth and motility, inhibiting the growth of cancer cells, modulating angiogenesis, inhibiting angiogenesis and vascularisation of tumours, modulating skin inflammation, stimulating the growth of epithelial cells, inhibiting the binding of human immunodeficiency virus (HIV) to leukcoytes, and treating inflammatory disease, cancer and neurological diseases. The polynucleotide can be used as a marker, in the identification of genetic disorders, and for the design of oligonucleotides for examining expression patterns.
                                                                                                                                                                                                                                                                                                                                                                                                                                     Murison JG;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated polynucleotide used in the identification of genetic disorders and encoding polypeptides used for treating inflammatory disease, cancer and neurological diseases .

cancer and neurological diseases. The proteins may be used to stimulate the growth and motility of keratinocytes, to inhibit the growth of cancer cells, to modulate angiogenesis and tumour vascularisation, to modulate skin inflammation, to modulate epithelial cell growth and to inhibit binding of HIV-1 to leukocytes. The invention may also be used to treat growth and developmental defects, skin wounds and hair follicle by obna sequences AAY75942-Y76123 represent polypeptides encoded by cbna sequences derived from several mouse, rat or human skin cell types. Sequences AAY75942-Y76121 represent polypeptides encoded by cbna sequences AAY75942-Y76197, AAY76020-Y76011, AAY76094-Y76104 and AAY761106-Y76109 and AAY76121-Y76122 are proteins with one or more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              121 SerCysGlnAsnAsnGlySerCysGluProThrSer...GlyAlaCysLe 136

```
The invention relates to novel nucleic acid sequences derived from rat dermal papilla, human keratinocytes and neonatal foreskin fibroblasts, and mouse embryonic skin, keratinocyte stem cells and transit amplifying calls. Polypeptides of the invention may be used to treat inflammation, cancer and neurological diseases. The proteins may be used to stimulate the growth and motility of keratinocytes, to inhibit the growth of cancer cells, to modulate angiogenesis and tummour vascularisation, to modulate skin inflammation, to modulate epithelial cell growth and to inhibit binding of HIV-1 to leukocytes. The invention may also be used to treat growth and developmental defects, skin wounds and hair follicle disorders. Sequences AAY75942-Y7531 represent polypeptides encoded by cDNA sequences AAY75942-Y75347, AAY76020-Y76021, AAY76034-Y76104 and AAY76119 are proteins with an N-terminal signal sequence, indicating that they are secreted. Sequences AAY75989, AAY76061-Y76011, AAY76106-Y76109 and AAY7611-Y76122 are proteins with one or more
